

# YOU WILL NEED:

- Baking soda
- Vinegar
- Water
- Plastic wrap (optional)
- Food colouring
- Small plastic dinosaurs (or other plastic items)
- Squirt bottle (an old ketchup or sauce bottle), eyedropper, or baster

**STEP 1:** Start by slowly adding water to a good load of baking soda. You want to add just enough until you get a crumbly but pack-able dough. It shouldn't be runny or soupy. You can divide the baking soda and water mixture into bowls and colour each one separately with food colouring. See below.

**Hint:** You could use multi colours but it's just an option. Plain or just one colour dino egg will be fun too!

**STEP 2:** Now to turn the baking soda mixture into dinosaur eggs! Pack the mixture around your plastic dinosaurs. You can use plastic cling wrap to help keep the shape if needed.

**STEP 3:** Place your dinosaur eggs in the freezer for as long as you like. The more frozen the eggs are, the longer it will take to melt them!

**STEP 4:** Add the dinosaur eggs to a large, deep dish or bucket and set out a bowl of vinegar! Let your child squirt the baking soda eggs and watch them fizz until the dinosaurs are hatched!
